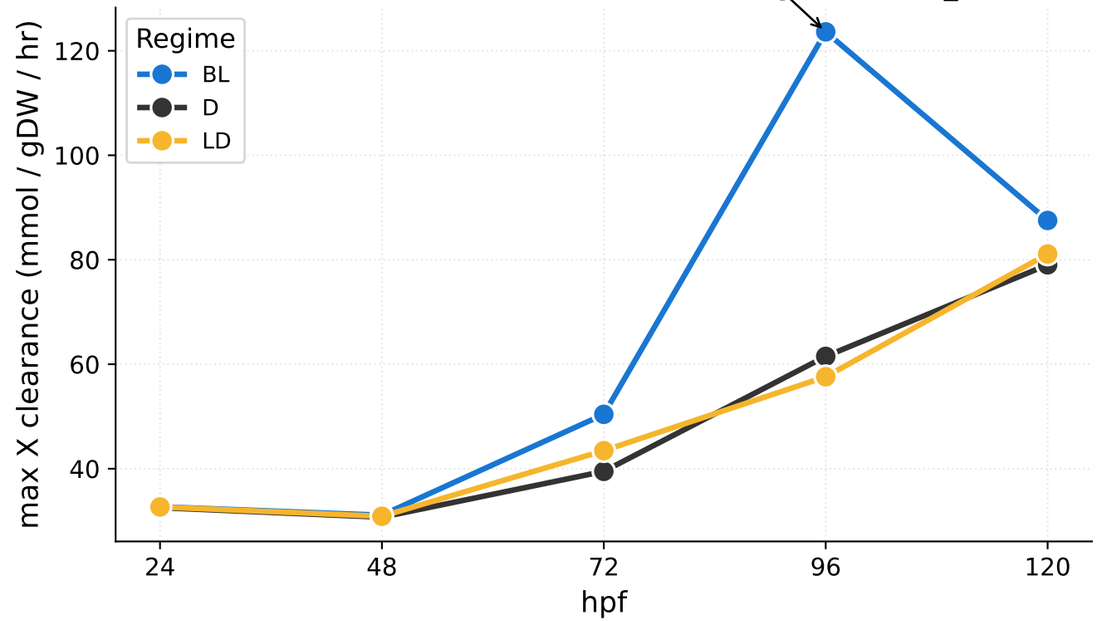
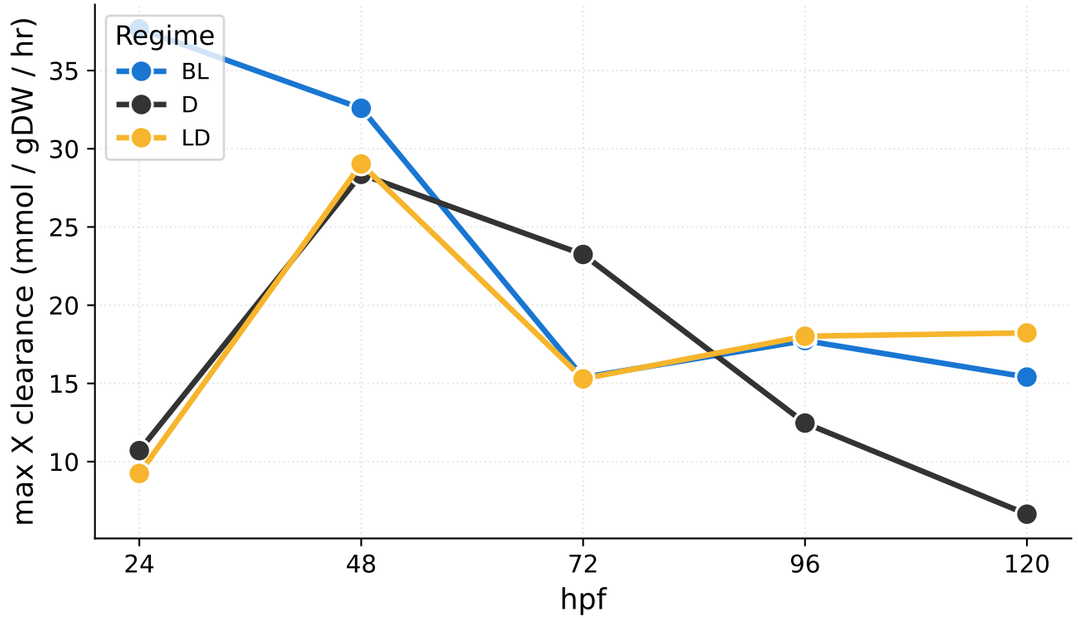
Figure C5 — Xenobiotic clearance: a cofactor-drain probe, not a toxicity model

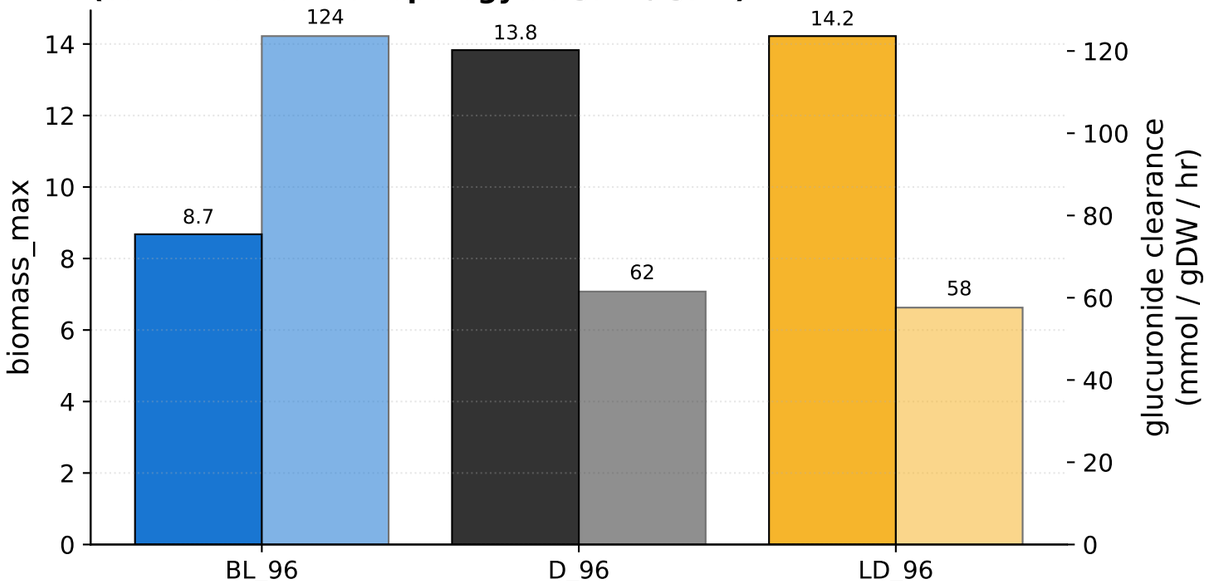
A Glucuronide route — rises with development; BL_96 outlier

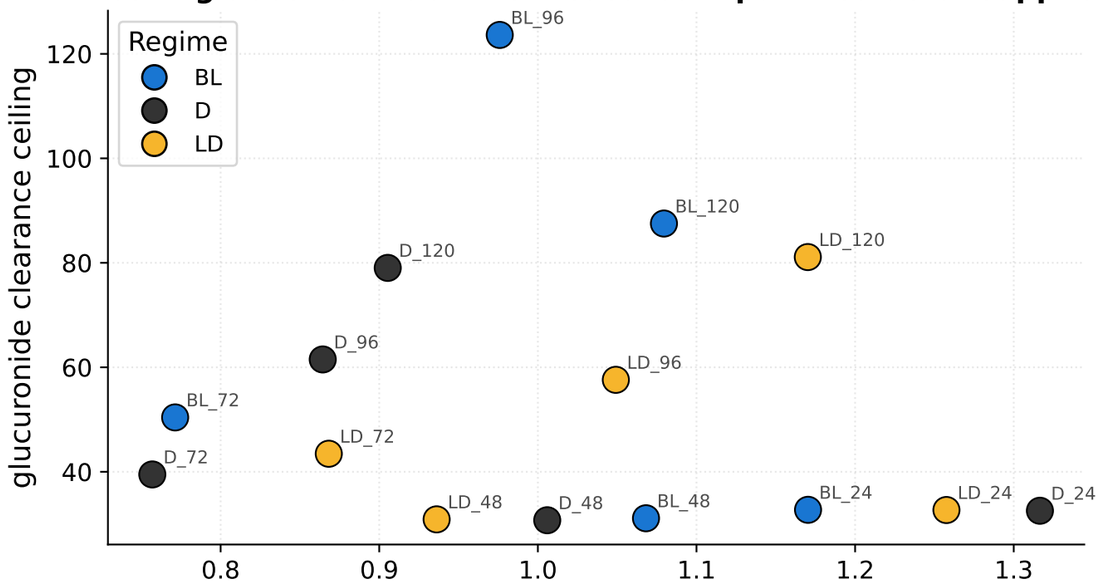


B Glutathione route — flat to falling



C At 96 hpf, BL has lower biomax → higher clearance (same isoleucine topology as §3.1 / §3.2)





D UDP-glucuronate fc vs ceiling — r = -0.12 ceiling does not track the measured input → cofactor supplied internally
